

# Labial Instability in Sound Change

The renowned historical linguist Hans Henrich Hock once commented that, for reasons that are not well understood, there sometimes appear curious gaps in the bilabial slot of languages series of obstruent phonemes. Hock based his comment on the observation that if a language lacks a voiceless stop at one of the cardinal points of articulation, the missing segment is almost always /p/. Labial Instability in Sound Change (Explanations for the loss of /p/) explains the driving force behind this phenomenon. The theory advanced by the book accounts for why, over time, languages lose the /p/ sound more often than any other voiceless stop (sounds of a similar class). The book describes the phenomenon of labial instability in articulatory and acoustic terms. Labial Instability in Sound Change argues for a particular school of sound change (John Ohalas phonetic theory) while clarifying the complex relationships among speech perception, acoustic and articulatory phonetics, language typology, and sound change.
